

Tawazon Collection Dashboard

Project Overview & Technical Summary

1. What it is

This is a **debt-collection management system** for Tawazon (Oman). A collections agency recovers money owed by **debtors** on behalf of **creditors** (banks, companies). This app is the internal tool staff use to manage that workflow — plus a **client portal** where creditors log in to watch progress on their own cases.

The core chain: A **Client** (creditor) hands over a **Case** against a **Debtor**. A **Collector** (staff) works the case — logging **Follow-ups**, recording **Payments**, and if it escalates to court, tracking it as a **Legal Case**.

2. Technology stack

- **Django 6.0.5** (Python 3.13) — server-rendered HTML, classic views + templates
- **SQLite** database (~1 MB) for now; planned move to **PostgreSQL** in production
- **Vanilla JavaScript** + templates for the UI (no React/Vue); Chart.js, FontAwesome, Inter font
- Exports via openpyxl (Excel), reportlab / pypdf (PDF), Pillow (images)

3. Scale of the codebase

Item	Count
Django models	41
Migrations	70 (latest: 0070_client_google_location)
URL routes	197
HTML templates	60
views.py	~5,600 lines
Seed data	130 clients, 143 debtors, 184 cases, 27 payments, 5 legal cases

4. The two interfaces

A. Staff / Admin dashboard

The main internal app (sidebar + topbar). Sections: Dashboard (KPIs, charts), Clients, Debtors (with duplicate detection), Cases (all cases, follow-ups, bulk follow-ups, case groups, pending payments), Legal Cases, Attendance, Reports (case status, collector, client, agency, collections, commission, receipts, activity logs), and Settings (users/groups, case & legal statuses, fee types, countries/states/currencies, lawyers, agencies, payment modes, client access).

Access control: **admin** (superuser) sees everything; **staff** see operational areas but are blocked from admin-only settings.

B. Client portal (/portal/)

A separate client-facing area. Creditors log in via **email OTP**, then see only the cases an admin has granted them, with per-section permissions (e.g. status but not financials).

5. The data model (grouped)

- **Core chain:** Client, Debtor, Case, Payment, FollowUp

- **Legal:** LegalCase, LegalFee, LegalCaseStatus, LegalFeeType, Lawyer
- **People/orgs:** ClientContact, DebtorContact, Agency, ContactDirectory, DebtorRelatedCompany
- **Config/lookups:** CaseType, CaseStatus, FollowupType, PaymentMode, ClientType, ContractType, ContactType, AttachmentType, Country, State, Currency, DebtorStatusOption
- **Users:** UserGroup, UserProfile
- **Portal:** ClientLoginAccess, ClientLoginOTP, ClientLoginLog, ClientCaseAccess
- **Auditing/productivity:** CaseHistory, ActivityLog, CaseAttachment, Reminder, Todo
- **Added this project:** AttendanceSession, ChatMessage

6. Features built in this engagement

- 1. Attendance & auto-logout** — Tracks staff login→logout sessions and hours worked (counted up to last activity, so idle time isn't paid). 20-minute idle auto-logout with a warning popup and a logout summary (hours + motivation line). Admins see everyone; staff see their own.
- 2. Smarter Cases list** — Closed and 'Legal Action Approved' cases are hidden by default for lighter loads, revealed by a 'Show All Cases' button.
- 3. 'Legal Action Approved' workflow** — A new case status that auto-creates a Legal Case, makes the row view-only, and mirrors the status into the legal record.
- 4. Full Legal Info panel** — On case detail: Change Legal Status (22 settings-managed statuses), lawyer, dates, judgement/outstanding/remaining/fee amounts (OMR), a Legal Fees table, and Legal Update History — with edit, plus View/Download/Delete on attachments.
- 5. Change Status / Collector fix** — Fixed the single-case buttons that were wrongly requiring Account No and failing.
- 6. Add Case wizard rebuild** — Client, Debtor, Creditor Name (only for agency clients), Received On, Case Type, Account No (mandatory + unique per client), Status, Collector, Country, Is-Agency + Select-Agency, Notes.
- 7. Add Client — Google Location** — A field to paste a Google Maps link for the client.
- 8. Client ↔ Staff chat** — Per-case messaging on both portal and dashboard. Clients message the staff handling their case; it lands in that collector's Chats inbox with a 'Case Details' jump. Includes avatars, quick-reply chips, a client-side auto-acknowledgement, edit / unsend / seen indicators, an indigo theme, and conversations shown as client + debtor + case ref.
- 9. Dark / light theme toggle** — Topbar switch, remembered per browser, applied before paint.
- 10. Ops / config** — Timezone set to Asia/Muscat, clean admin/staff demo credentials created, and an ngrok tunnel set up for live testing.

7. Current state & deployment

- Runs locally: **python manage.py runserver** — logins admin / Admin@12345 and staff / Staff@12345.
- Target production: **DigitalOcean droplet + PostgreSQL**, served at a subdomain such as dashboard.tawazonoman.com via the existing Cloudflare domain.
- Production config (env-driven settings, requirements.txt, gunicorn/nginx, DEPLOY.md) is planned but not yet generated.
